

If you fail to detect red flags in advance, it exposes you to higher default rates and the loss of revenue. But the only way to build more accurate risk models is to utilize more or new data. DRNsights Risk Scoring provides vehicle location insights that you can use to build stronger models and help better understand the collectability of your portfolio.

Act with New Certainty

Vehicle location data provides insights on the collectability of a portfolio. Understand when given addresses may not be accurate, and when new ones verified with our license plate recognition data can help you make contact.

Inform Sales and Purchases

If real-time location data can enable right-party contact, you may pursue collection before you sell. And when you're considering a purchase, you can evaluate risk by quickly understanding accuracy of given data.

Improve Collection Rate

Clustered vehicle sightings can tell you when a vehicle is consistently located at a specific address. Put this data to work by making contact – and collecting – on loans in your for-sale portfolio before you sell.

THE IMPACT OF COVID-19

"Greater emphasis is needed on augmenting traditional data with inferences from alternative data sources."

HOW IT WORKS

DRNsights Risk Scoring in action

010112448124

Upload account addresses and VINs which we will convert to license plates.

02

We will score each account by comparing given addresses to our vehicle sightings.

03

Review the risk report that we create to make more informed account decisions.

Real data, real analytics, real results.
